

Global schedule reliability drops to 51.4% in September 2024

Sea-Intelligence has published issue 158 of the *Global Liner Performance (GLP) report*, with schedule reliability figures up to and including September 2024. As the report itself is quite comprehensive and covers schedule reliability across 34 different trade lanes and 60+ carriers, this press release will only cover the global highlights from the full report.

In September 2024, global schedule reliability declined by -1.2 percentage points M/M to 51.4%. While schedule reliability in 2024 has stabilised within the 50%-55% range, it's been on a slight downwards trend since the May peak. The low levels of volatility in schedule reliability in 2024 *do* give shippers a relatively good idea of what to expect M/M. The average delay for LATE vessel arrivals increased by 0.21 days M/M to 5.67 days. This is the third-highest figure for the month, only surpassed by pandemic highs of 2021-2022.

Maersk was the most reliable top-13 carrier in September 2024 with schedule reliability of 55.5%. CMA CGM followed with schedule reliability of 50.9%, as the only two carriers above the 50% mark. The remaining 11 carriers were all in the 40%-50% range. Wan Hai was the least reliable with 40.4% schedule reliability. Only four of the top-13 carriers were able to record a M/M improvement in schedule reliability in September 2024, with PIL recording the largest increase of 4.5 percentage points, and HMM recording the largest decline of -7.8 percentage points. On a Y/Y level, none of the top-13 carriers saw an improvement in schedule reliability, with MSC and Wan Hai recording the largest decline of -21.5 percentage points each.
